

ABSTRACT

The study focuses on the development of dairying in the Cooperative Sector. The two systems, the cooperative evolved at Anand and the developing cooperatives are described and discussed vis-a-vis a true cooperative.

Data pertaining to variables related to dairying in the cooperative system were collected from 48 societies chosen for the study and analysed with the nested design of analysis of variance and factor analysis techniques.

Factors were identified for the development of dairying in general, and for the development in the cooperative sector. The results were used to suggest the implications for the management of dairy development.
