To Nana, Nani, Maa, and Papa

All that I am, or hope to be, I owe it to you all...

ACKNOWLEDGEMENTS

I would like to thank my DAC members, Prof. Dinesh, Prof. Tirthatanmoy, and Prof. Rajluxmi for their constant help throughout the journey. This thesis would not have been possible without their guidance and support.

Prof. Dinesh has been a source of positivity and inspiration for me throughout the journey. His calm, thoughtful and empathetic nature added comfort to every conversation, and I could reach out to him anytime I needed help. I am thankful to him beyond words for teaching me numerous life skills that have helped me grow not only as a researcher but also as a person. I also had the opportunity to work with Prof. Tirthatanmoy, and I am extremely thankful to him for helping me out when I was stuck. I have learned a lot from him in terms of analytical thinking, research detailing, and most importantly, humility. I consider myself extremely fortunate to have worked closely with both Prof. Dinesh and Prof. Tirthatanmoy, two of the most kind and humble people I met at IIMB. I would also like to thank Prof. Rajluxmi for her support and inputs in the journey. I am deeply grateful to my external examiners, Prof. Usha Ananthakumar and Prof. M. Mathirajan, for examining my thesis and providing valuable feedback.

I am grateful to Doctoral Programme Chairs, Prof. Ananth and Prof. Haritha, for their support during critical times. I would like to thank members of the Doctoral Program Office, Ms. Ashoka, Ms. Shilpa, Mr. Srinath and Mr. Shankarappa for their support in official aspects of the program. A significant part of my PhD journey was spent during the Covid pandemic, and I am grateful to the institute, mess, security, and housekeeping teams for their help during those unprecedented times. It was because of their collective efforts that I could focus on my work even during the pandemic.

ACKNOWLEDGEMENTS

A huge shout out to my friends who have almost been like a family. I am happy that I came across and had good time with Antra, Anupama, Aqsa, Banantika, Bibek, Bhandari, Chhavi, Mallika, Manu, Shahrukh, Shivangi, and Tanya. I am grateful to my seniors, Dr. Pranjal, Dr. Giriraj, and Dr. Gopi who heard me out and resolved my doubts many times. Special thanks to Dr. Giriraj, who always remained in touch, helped me resolve my tiniest confusion, and ensured that I did not lose hope. Thanks to my friends outside of academia: Janki, Sabarni, Nirankur, and Piyush, for keeping me sane on this journey.

I can't thank Prashant enough for always being there for me, for being my biggest support system throughout this journey, and for taking care of me while I was struggling emotionally, and physically. There are no words to express my gratitude, and I know for a fact that I couldn't have done it without you!

I'd also like to recognize two of my teachers who had a significant influence on my life. My schoolteacher, Ms. Nutan, who taught me the importance of honesty and hard work, which were crucial in the PhD journey, and late Prof. Padmawar from ISI Bangalore, who was kind enough to offer me an internship. It was during this time that I gained interest in research and teaching.

I am grateful and forever indebted to my parents for their support, love, and motivation. Thanks to my brother, sister, and niece for being a huge source of energy and love. Finally, a big thanks to the universe for taking care of me, guiding me, and providing for everything in my life.

ACRONYMS AND NOTATIONS

DFS:	Daily Fantasy Sports
OFS:	Online Fantasy Sports
TFE:	True Fixed Effects
UIGEA:	Unlawful Internet Gambling Enforcement Act of 2006
TF-IDF:	Term Frequency - Inverse Document Matrix
S_{ict}	Score of contestant i in her t^{th} contest (labelled as contest ‘ c ’)
w_c	Score of the winner of contest c
ScoreGap_{ict} or y_{ict}	$w_c - S_{ict}$. Difference in a contestant’s score and winner’s score
Prop10_{ict}	Proportion of times contestant i was in the top 10 th percentile before her t^{th} contest (labelled as contest ‘ c ’)
Prop25_{ict}	Proportion of times contestant i was in the top 25 th percentile before her t^{th} contest (labelled as contest ‘ c ’)
Prop40_{ict}	Proportion of times contestant i was in the top 40 th percentile before her t^{th} contest (labelled as contest ‘ c ’)
ContestSize_c	Number of contestants allowed to participate in contest c
ContestType_c	1, if the contest c was a private contest 0, if the contest c was a public contest
ExpPaid_{ict}	Number of paid contests played by the contestant i before her t^{th} contest (labelled as contest ‘ c ’)
ExpFree_{ict}	Number of free contests played by the contestant i before her t^{th} contest (labelled as contest ‘ c ’)

ACRONYMS AND NOTATIONS

δ_c	Unpredictable determinants of score of c^{th} contest's winner
η_{ict}	Unpredictable determinants of contestant i 's score in her t^{th} contest (labelled as contest 'c')
v_{ict}	$\eta_{ict} + \delta_c$. Denotes time-varying chance elements influencing contestant i 's winnability in her t^{th} contest (labelled contest 'c')
σ_v^2	$\sigma_\eta^2 + \sigma_\delta^2$. Denotes variance in time-varying chance elements
$\tilde{\alpha}_i$	Contestant (i)-specific effects
u_{ict}	Time-varying inefficiency of contestant i in her t^{th} contest (labelled as contest 'c')
σ_u^2	Variance in time-varying inefficiency
ϵ_{ict}	$\tilde{v}_{ict} - u_{ict}$
μ	Mean value of time-varying inefficiency
λ	$\frac{\sigma_u^2}{\sigma_v^2}$. Indicator of relative importance of inefficiency and chance
LDA:	Latent Dirichlet Allocation
DTM:	Document Token Matrix
CountTweets_{it}	Number of tweets by i^{th} DFS operator in t^{th} month
AvgLikes_{it}	Average number of likes received on tweets posted by operator i in month t
UserSentiment_{it}	Average polarity value of user tweets in month t referring to operator i
CommunitySize_{it}	Number of twitter followers of operator i in month

Abstract

Daily Fantasy Sports (DFS), an emerging business, has observed tremendous growth across many countries. This business has gained attention from policymakers and the judiciary because of several legal cases relating to the format adopted by DFS platforms. As suggested by the judiciary and government think tanks such as NITI Aayog, there is a need to adopt statistical, data-driven approaches to address these problems. This thesis looks at three business problems related to this sector. The first problem concerns skill versus chance dominance in DFS platforms, i.e., whether contestants' performance in DFS contests is influenced more by their skill or by chance elements. Many countries use this criterion to draw a distinction between skill-dominant gaming activities (which are legal) and gambling activities (which are considered illegal in many countries). Chapter 3 of the thesis presents a robust, empirical approach to evaluating the effect of contestants' skill and chance elements on their performance. Using a fixed effect stochastic frontier technique, we model contestants' skills and the random chances they face as two distinct error components determining their success in DFS contests. We distinguish the effect of a contestant's skill not only from chance elements but also from contestant-specific time-invariant factors such as their prior knowledge of the game. Utilizing panel data from cricket-based daily fantasy contests, we find that the effect of skill is significantly greater than that of chance, implying that contestants' skills play a dominant role over chance in determining their success in DFS contests. We also observe that contestants' performances in a contest depend on their past performances, choices of contests, and prior experiences.

While Chapter 3 looks at assessing the effect of skill and chance in DFS setup, Chapter 4 of the thesis examines how we design a skill-dominant fantasy sports. Chapter 4 identifies parameters that affect the skill-chance balance of the game. It is often a problem for the DFS operators to ensure that the design of their gaming platform is skill-dominant by construct. We analytically show that a.) the number of athletes needed in a fantasy team, b.) the number of constraints imposed on team selection (in the case of individual sports and team sports), and c.) the number of available athletes for team creation influence the overall skill-chance balance of the game. This chapter also describes in detail the regulatory challenges faced by state governments and regulators. Based on insights from other countries that faced similar issues, a data-driven regulatory framework has been proposed that a.) classifies online games based on their nature of activities, b.) Lays separate guidelines addressing problems with each of these categories, c.) Draws a distinction between games of skill and games of chance quantitatively, d.) Lays guidelines for designing a skill-dominant game, and e.) Promotes responsible gaming and criminalizes deceptive advertising and fraudulent activities.

In Chapter 5, we discuss how an emerging business like DFS can utilize social media information to interact with its users, comprehend users' experiences, gain insights from user-generated content, achieve more visibility, and expand its online community. Since businesses often use social media platforms like Twitter, Facebook, etc., to engage with their users, announce developments, promote their products, etc., these platforms are considered a medium for the diffusion of social information. Building a larger online community helps firms to disseminate information to a larger audience, gain more visibility and increase their business value. However, research on how firms can grow and learn from their online community is limited. Using a text analytics approach, we quantify the effect of operator-initiated engagement (number of tweets posted by the

operator's official handle and users' response to these tweets) and users' perception of a DFS operator (reflected in user-generated content) and study their association with operator's online community size.

We find that the extent and quality of operator-initiated online engagement and users' perception have a positive, significant effect on the operator's online community size. However, the marginal effect of users' perception of an operator is significantly greater than that of the operator-initiated engagement, thus indicating that users' experiences send a much stronger signal than the official tweets posted by DFS operators in influencing users' decision to join or quit the operator's online community. The chapter also identifies the different user experiences using Latent Dirichlet Allocation (LDA) that have an impact on how users view the business generally and can be used by businesses to find areas that need improvement.

The first two problems addressed in this thesis (Chapters 3 and 4) have direct implications for policymakers working on a regulatory framework for DFS and the online gaming sector in general. The third problem (Chapter 5) aids in understanding user experience and devising strategies to expand the online community. The thesis addresses contemporary issues, uses data-driven approaches to resolve them, and hopes to contribute towards evidence-based policymaking. It contributes to the literature on data-driven decision making, decisions under uncertainty, online community, and online engagement. We expect the thesis' conclusions will aid the DFS industry, the online gaming sector, regulators, and the judiciary in making data-driven decisions.
